Oxygen is a chemical element with symbol O and atomic number 8. It is a member of the chalcogen group on the periodic table, a highly reactive nonmetal, and an oxidizing agent that readily forms oxides with most elements as well as with other compounds. By mass, oxygen is the third-most abundant element in the universe, after hydrogen and helium. At standard temperature and pressure, two atoms ...

The CNO cycle (for carbon–nitrogen–oxygen) is one of the two known sets of fusion reactions by which stars convert hydrogen to helium, the other being the proton–proton chain reaction (pp-chain reaction). Unlike the latter, the CNO cycle is a catalytic cycle. It is dominant in stars that are more than 1.3 times as massive as the Sun.. In the CNO cycle, four protons fuse, using carbon ...

Hydrogen sulfide (H<sub>2</sub>S) is a poisonous, highly flammable, colorless gas that is associated with a “rotten egg” odor. As stated by chealth.org, “hydrogen sulfide is created naturally by decaying organic matter and is released from sewage sludge, liquid manure, and sulfur hot springs.”

Splitting water into hydrogen and oxygen to produce clean energy can be simplified with a single catalyst developed by scientists at Rice University and the University of Houston.

1. Introduction. Oxygen reduction reaction (ORR) and oxygen evolution reaction (OER) are becoming increasingly important electrochemical reactions due to growing emphasis on sustainable power generation technologies , . An example of this class of technologies is a proton exchange membrane (PEM) fuel cell where hydrogen (fuel) is oxidized at the anode producing protons which are transported ...

Metallic iridium and ruthenium as well as their oxides are among the most active oxygen evolution (OER) electrocatalysts in acidic media, and are also of interest for the catalysis of the hydrogen evolution (HER).
