ABSTRACT. Poly (p-phenylene terephthalamide) fibers prepared by wet or dry-jet wet spinning processes have a notable response to very brief heat treatment (seconds) under tension.

**Microstructural developments of poly (p-phenylene**

The rapidly increasing population, depleting water resources, and climate change resulting in prolonged droughts and floods have rendered drinking water a competitive resource in many parts of the world. The development of cost-effective and stable materials and methods for providing the fresh water in adequate amounts is the need of the water industry.

1. Introduction. Detergents are indispensable as solubilizing agents in the isolation and purification of membrane proteins , , , , , .Detergents permit us to study the detailed properties of membrane proteins in protomeric and self-associated states as well as in their interactions with other proteins.
